## **About This Manual**

This manual is intended for use by service technicians responsible for installing and servicing IQ plus<sup>®</sup> 590-DC digital weight indicators.

Configuration and calibration of the indicator can be accomplished using the indicator front panel keys, the EDP command set, or Version 2.2 or later of the Revolution Scaleware  $^{\text{TM}}$  configuration utility. See Section 3.1 on page 11 for information about configuration methods.

Some procedures described in this manual require work inside the indicator enclosure. These procedures are to be performed by qualified service personnel only.

Authorized distributors and their employees can view or download this manual from the Rice Lake Weighing Systems distributor site at www.rlws.com.

The *Operator Card* included with this manual provides basic operating instructions for users of the IQ plus 590-DC. Please leave the *Operator Card* with the indicator when installation and configuration are complete.

## 1.0 Introduction

The IQ plus 590-DC is a single-channel digital weight indicator housed in a NEMA 4X/IP66-rated stainless steel enclosure. The indicator front panel consists of a 1-inch (25 mm), six-digit, liquid crystal (LCD) display and 19-button keypad. Features include:

- Drives up to four  $350\Omega$  or eight  $700\Omega$  load cells
- Supports 4- and 6-wire load cell connections
- Electronic data processing (EDP) port for full duplex, RS-232 communications at up to 19200 bps
- Powered by 6 C batteries for complete portability
- AC adapter for 115 or 230 VAC power
- Configurable standby mode limits indicator power consumption when scale is inactive
- Piece count mode for basic parts counting functions.

The IQ plus 590-DC is NTEP-certified for Classes III and III L at 10,000 divisions. See Section 8.8 on page 42 for detailed specifications.

## 1.1 Operating Modes

The IQ plus 590-DC has several modes of operation:

#### Normal (weighing) mode

Normal mode is the "production" mode of the indicator. The indicator displays gross or net weights as required, using the LCD annunciators described in Section 1.3 on page 3 to indicate scale status and the type of weight value displayed. Once configuration is complete and a legal seal is affixed to the back of the indicator, the IQ plus 590-DC can operate only in normal mode.

#### Piece count mode

In piece count mode, the indicator display shows the number of parts on the scale rather than the weight of those parts. Piece count mode has two submodes:

- Count display mode displays the current parts count and allows ticket printing using the CFMT print format.
- Sample acquisition mode is used to calibrate the indicator for parts counting.

Operator access to piece count mode is disabled when the indicator is shipped from the factory. See Section 6.0 on page 29 for detailed information about counting operations.

#### Setup mode

Most of the procedures described in this manual require the indicator to be in setup mode, including configuration and calibration.

To enter setup mode, remove the large fillister head screw from the enclosure backplate. Insert a screwdriver or a similar tool into the access hole and press the setup switch once. The indicator display changes to show the word *CONFIG*.

#### Test mode

Test mode provides a number of diagnostic functions for the IQ plus 590-DC indicator. Like setup mode, test mode is entered using the setup switch. See Section 8.7 on page 40 for more information about entering and using test mode.

#### Standby mode

Standby mode is a configurable low-power mode used to extend battery life when the indicator is inactive. In standby mode, the LCD display shows the word *STNDBY*; press any key to exit standby mode. See Section 3.2.5 on page 20 for information about configuring standby mode.

## 1.2 Front Panel Keypad

Figure 1-1 shows the IQ plus 590-DC front panel keys and the key functions assigned in normal mode.

The symbols shown above the keys in Figure 1-1 (representing up, down, enter, left, right) describe the key functions assigned in setup mode. In setup mode, the keys are used to navigate through menus, select digits within numeric values, and increment/decrement values. See Section 3.1.3 on page 12 for information about using the front panel keys in setup mode.

Labels under the keys in Figure 1-1 describe the key functions used in piece count mode. See Section 6.0 on page 29 for more information about counting operations.

## NORMAL MODE KEY FUNCTIONS

Figure 1-1. Front Panel Key Functions in Normal Mode

## 1.3 Display Annunciators

The IQ plus 590-DC display uses a set of LCD annunciators to provide additional information about the value being displayed. Figure 1-2 on page 3 shows these annunciators and their meanings.

**G** The displayed weight is a gross weight.

**N** The displayed weight is a net weight.

Scale is at standstill or within the specified motion band. Some operations, including zero, tare, and printing functions, can only be done when the standstill symbol is shown.

Center of zero. Gross weight is within 0.25 graduations of zero. This annunciator lights when the scale is zeroed.

Indicates that a tare has been entered. The tare value can be entered by pressing the TARE key on the keypad or by sending the KTARE EDP command. See Section 5.0 on page 25 for information about the EDP command set.

Indicates that the battery charge is low.

## lb, kg, PC

Three arrow annunciators on the right side of the LCD display indicate the units associated with the displayed value. The bottom arrow annunciator (PC) is lit when the indicator is in piece count mode. The top and middle arrows, labeled lb and kg, show primary and secondary units, as described below:

- If the displayed weight is in pounds, the top arrow (lb) is lit; if kilograms, the middle arrow (kg) is lit.
- If the primary unit of weight is pounds, the middle (kg) arrow is lit for secondary units—or, if the primary unit is kilograms, the top (lb) arrow is lit for secondary units, unless the secondary unit of weight is the same as the primary unit.
- If neither primary nor secondary units are pounds or kilograms, the top arrow is used as a primary units annunciator and the middle arrow is used as the secondary units annunciator. A set of replacement overlay decals is included in the parts kit for units other than pounds and kilograms.

See Section 3.2.2 on page 16 for information about configuring primary and secondary display units.

Figure 1-2. IQ plus 590-DC Display Annunciators

## 1.4 Indicator Operations

Basic IQ plus 590-DC operations are summarized below:

#### 1.4.1 Toggle Gross/Net/Piece Count Mode

Press the GROSS/NET key to switch the display mode between gross, net, and piece count modes. If a tare value has been entered or acquired, the net value is the gross weight minus the tare. If access to piece count mode is disabled, pressing the GROSS/NET key switches between gross and net modes only.

Gross mode is shown by the **G** annunciator; net mode is shown by the **N** annunciator. Piece count mode is shown by the LCD annunciator adjacent to the **PC** at the right edge of the display.

#### 1.4.2 Toggle Units

Press the UNITS key to switch between primary and secondary units. The units annunciator arrow on the right side of the LCD display points to the units identifier.

#### 1.4.3 Zero Scale

- 1. In gross mode, remove all weight from the scale and wait for the standstill annunciator ( ).
- 2. Press the ZERO key. The center of zero (→0←) annunciator lights to indicate the scale is zeroed.

#### 1.4.4 Acquire Tare (Pushbutton Tare)

- 1. Place container on scale and wait for the standstill annunciator ( ).
- 2. Press the TARE key to acquire the tare weight of the container.
- 3. Net weight is displayed and the annunciator lit to show the tare value was acquired.

#### 1.4.5 Enter Tare (Keyed Tare)

- 1. Use the numeric keypad to enter the tare value, then press the TARE key.
- 2. Net weight is displayed and the annunciator lit to show the tare value was entered.

#### 1.4.6 Remove Stored Tare Value

- 1. Remove all weight from the scale and wait for the standstill annunciator ( ).
- 2. Press the TARE key. The annunciator goes off, indicating the tare value has been removed.

Indicators with the REGULA parameter set to NONE or NTEP (see Section 3.2.5 on page 20) can clear a stored tare value using the following procedure:

- Press DISPLAY TARE to show the stored tare value.
- 2. Press the CLEAR key twice to remove the stored tare.

#### 1.4.7 Print Ticket

- 1. Wait for the standstill annunciator ( ).
- 2. Press the PRINT key to send data to the serial port.

#### 1.4.8 Acquire Parts Sample

- 1. Place empty parts container on scale. Wait for the standstill annunciator ( ), then press TARE to acquire the tare weight of the container.
- 2. Press MODE to enter piece count mode.
- 3. Press the SAMPLE (UNITS) key to enter sample acquisition mode.
- 4. The indicator display shows the message *Addnnn*, where *nnn* is the sample quantity to be placed on the scale. You can do one of the following:
  - Add the number of parts shown.
  - Choose a different sample size. Press the SAMPLE key to scroll through the selectable sample quantities (5, 10, 20, 50, 100) or use the numeric keypad to specify a custom sample size.
  - Specify a known piece weight. Press the SAMPLE key to scroll through the selectable sample quantities until the *PC WGT* prompt is shown. Use the numeric keypad to enter the piece weight.
- 5. Once the sample quantity is on the scale, press ENTER to calibrate the indicator for counting the new parts. If a sample size was specified, the indicator display shows the message -CNT- as it acquires the sample weight, then switches to count display mode and shows the part quantity. If a known piece weight was specified, the display switches to count display mode immediately.

## 2.0 Installation

This section describes procedures for connecting load cell and serial communications cables to the IQ plus 590-DC indicator. Instructions for battery and CPU board replacement are included, along with assembly drawings and parts lists for the service technician.

Use a wrist strap to ground yourself and protect components from electrostatic discharge (ESD) when working inside the indicator enclosure.

## 2.1 Unpacking and Assembly

Immediately after unpacking, visually inspect the IQ plus 590-DC to ensure all components are included and undamaged. The shipping carton should contain the indicator with attached tilt stand, this manual, and a parts kit. If any parts were damaged in shipment, notify Rice Lake Weighing Systems and the shipper immediately.

The parts kit contains the items listed below:

- Capacity, annunciator, and identification labels. The annunciator label (PN 53374) provides replacement overlay decals for the displayed units annunciators.
- 3-position (PN 15888) and 7-position (PN 23165) pluggable terminal blocks for load cell and serial communications connectors.

- One 8-32NC x 7/16 fillister head screw (PN 30623). This screw occupies the hole below the setup switch access screw on the indicator backplate (see Figure 2-4 on page 7).
- Two 8-32NC x 3/8 machine screws (PN 14862) for the indicator backplate (see #10 in Figure 2-7 on page 10).
- Five neoprene washers (PN 45042) for backplate screws included in the parts kit.
- Four rubber bumpers ("feet") for the tilt stand, PN 42149.
- Two each of grounding clamps (PN 53075), external tooth lock washers (PN 15133), and kep nuts (PN 14676) for cable shield grounding against the backplate.

## 2.2 Enclosure Disassembly

The indicator enclosure must be opened to connect load cell and communications cables.

Power off the indicator and disconnect the AC adapter, if necessary. Place the indicator face-down on an antistatic work mat. Remove the screws that hold the backplate to the enclosure body, then lift the backplate away from the enclosure. Disconnect battery cable to connector J3, then set the backplate assembly aside.

#### 2.3 Cable Connections

The IQ plus 590-DC provides two cord grips for cabling into the indicator: one for the load cell cable, the other for serial communications.

Figure 2-1. IQ plus 590-DC Backplate, Showing Key Component Locations

#### 2.3.1 Cable Grounding

Except for the power cord, all cables routed through the cord grips should be grounded against the indicator backplate. Do the following to ground shielded cables:

- Use the lockwashers, clamps, and kep nuts provided in the parts kit to install grounding clamps on the backplate studs adjacent to cord grips. Install grounding clamps only for cord grips that will be used; do not tighten nuts.
- Route cables through cord grips and grounding clamps to determine cable lengths required to reach cable connectors. Mark cables to remove insulation and shield as described below:
  - For cables with foil shielding, strip insulation and foil from the cable half an inch (15 mm) past the grounding clamp (see Figure 2-2). Fold the foil shield back on the cable where the cable passes through the clamp. Ensure silver (conductive) side of foil is turned outward for contact with the grounding clamp.
  - For cables with braided shielding, strip cable insulation and braided shield from a point just past the grounding clamp. Strip another half inch (15 mm) of insulation *only* to expose the braid where the cable passes through the clamp (see Figure 2-2).
- For load cell cables, cut the shield wire just past the grounding clamp. Shield wire function is provided by contact between the cable shield and the grounding clamp.
- Route stripped cables through cord grips and clamps. Ensure shields contact grounding clamps as shown in Figure 2-2. Tighten grounding clamp nuts.
- Finish installation using cable mounts and ties to secure cables inside of indicator enclosure.

Figure 2-2. Grounding Clamp Attachment for Foil-Shielded and Braided Cabling

NOTE: A grounding screw is provided on the indicator backplate for connecting a grouding wire (see Figure 2.4 on page 7).

#### 2.3.2 Load Cells

To attach cable from a load cell or junction box, remove connector J1 from the board. The connector plugs into a header on the board. Connect cable from the load cell or junction box through the load cell cable cord grip to connector J1 as shown in Table 2-1. If using 6-wire load cell cable (with sense wires), remove jumpers JP1 and JP2 before reinstalling connector J1 (see Figure 2-3 on page 7). For 4-wire installation, leave jumpers JP1 and JP2 on.

When connections are complete, reinstall connector J1 on the board.

J1 Pin	Function
1	+SIG
2	-SIG
3	+SENSE
4	-SENSE
5	SHIELD (see NOTE below)
6	+EXC
7	–EXC

#### NOTES:

- SHIELD wire connection not used. Use grounding procedure described in Section 2.3.1 on page 6.
- For 6-wire connections, remove jumpers JP1 and JP2.

Table 2-1. J1 Pin Assignments

#### 2.3.3 Serial Communications

To attach serial communications cables, remove connector J2 from the board (see Figure 2-3 on page 7). Connect communications cable through cord grip to connector J2 as shown in Table 2-2.

Once cables are attached, reconnect J2 to the header on the board.

The IQ plus 590-DC serial port supports full duplex RS-232 communications for connections to printers, PCs, and other attached devices. See Section 3.0 on page 11 for general configuration information; see Section 3.2.4 on page 19 for serial port configuration.

J2 Pin	Function
1	RS-232 TxD
2	RS-232 Ground
3	RS-232 RxD

Table 2-2. J2 Pin Assignments

Figure 2-3. IQ plus 590-DC CPU Board

## 2.4 Enclosure Reassembly

Once cabling is complete, position the backplate over the enclosure, reconnect battery cable, and reinstall the backplate screws. Use the torque pattern shown in Figure 2-4 to prevent distorting the backplate gasket. Torque screws to 15 in-lb (1.7 N-m).

Figure 2-4. IQ plus 590-DC Enclosure Backplate

## 2.5 Battery Installation

To install or replace batteries, do the following:

- 1. Remove the four thumbscrews that hold the battery cover to the enclosure backplate.
- 2. Install six alkaline C-cell batteries as shown in Figure 2-5.
- 3. Replace the battery cover and reinstall thumbscrews. Torque thumbscrews to 15 in-lb (1.7 N-m).

Figure 2-5. Battery Installation

## 2.6 AC Adapter

The AC adapter can be used to provide power to the indicator if battery power is low and AC power is available. Use only the adapter supplied with the indicator.

To use the AC adapter, do the following:

- 1. Remove the top screw from the AC adapter port cover.
- 2. Loosen the bottom screw, then rotate the port cover to expose the AC adapter port (see Figure 2-6).
- 3. Reinstall the top screw in the backplate.
- 4. Plug AC adapter from power outlet to the indicator adapter port.

Close the adapter port cover and reinstall screws as described in Section 2.4 when not using the AC adapter.

The IQ plus 590-DC enclosure cannot be rated for NEMA 4X/IP66 applications with the AC adapter port cover open.

Do not use the AC adapter in washdown environments.

Figure 2-6. AC Adapter Port Cover

## 2.7 Board Removal

If you must remove the IQ plus 590-DC CPU board, use the following procedure:

1. Disconnect power to the indicator. Loosen cord grips and remove backplate as described in Section 2.2 on page 5.

## 2.8 Replacement Parts

Table 2-3 lists replacement parts for the IQ plus 590-DC, including all parts referenced in the assembly drawing (see Figure 2-7 on page 10).

Ref Number	PN	Description (Quantity)
1	49520	Battery cover thumb screws (4)
_	47939	Battery cover - old style 4 x 4.5" dimension (1)
2	71352	Battery cover - new style 3 x 7" dimension (1)
_	49557	Battery cover gasket - old style (1)
3	71354	Battery cover gasket - new style (1)
_	49909	Battery holder assembly (1)
4	71448	Battery holder assembly (1)
5	19538	Cable grip plug (1)
6	42640	Setup switch access screw, 1/4 x 28NF x 1/4 (1)
7	15626	Cable grips, PG9 (2)
8	44676	Sealing washer for setup switch access screw, #14 (1)
9	30375	Nylon seal rings for cable grips (2)
10	14862*	Screws, 8-32NC x 3/8 (2)
11	45042	Sealing washers, #8 (3)
_	51970	Enclosure backplate - old style (1)
12	71435	Enclosure backplate - new style (1)
13	15627	Locknuts, PCN9 (2)
14	52382	Backplate gasket (1)

Table 2-3. Replacement Parts

Ref Number	PN	Description (Quantity)		
15	14626	Kep nuts, 6-32NC hex (4)

Table 2-3. Replacement Parts (Continued)

Figure 2-7. IQ plus 590-DC Assembly

# 3.0 Configuration

To configure the IQ plus 590-DC indicator, the indicator must be placed in setup mode. The setup switch is accessed by removing the large fillister head screw on the enclosure backplate. Switch position is changed by inserting a screwdriver into the access hole and pressing the switch.

When the indicator is placed in setup mode, the word CONFIG is shown on the display. The CONFIG menu is the first of seven main menus used to configure the indicator. Detailed descriptions of these menus are given in Section 3.2. When configuration is complete, return to the CONFIG menu and press the  $\triangle$  (ZERO) key to exit setup mode, then replace the setup switch access screw.

## 3.1 Configuration Methods

The IQ plus 590-DC indicator can be configured by using the front panel keys to navigate through a series of configuration menus or by sending commands or configuration data to the EDP port. Configuration using the menus is described in Section 3.1.3.

Configuration using the EDP port can be accomplished using either the EDP command set described in Section 5.0 or Version 2.2 or later of the Revolution<sup>™</sup> Scaleware configuration utility.

#### 3.1.1 Revolution Scaleware Configuration

The Revolution Scaleware configuration utility provides the preferred method for configuring the IQ plus 590-DC indicator. Revolution runs on a personal computer to set configuration parameters for the indicator. When Revolution configuration is complete, configuration data is downloaded to the indicator.

Figure 3-1. Sample Revolution Scaleware Format Display

Revolution supports both uploading and downloading of indicator configuration data. This capability allows configuration data to be retrieved from one indicator, edited, then downloaded to another.

To use Revolution Scaleware, do the following:

- 1. Install Revolution on an IBM-compatible personal computer running Windows® 3.11 or Windows 95. Minimum system requirements are 8MB of extended memory and at least 5MB of available hard disk space.
- With both indicator and PC powered off, connect the PC serial port to the RS-232 pins on the indicator EDP port.
- 3. Power up the PC and the indicator. Use the setup switch to place the indicator in setup mode.
- 4. Start the Revolution Scaleware program.

Figure 3-1 shows an example of one of the Revolution Scaleware configuration displays.

Revolution provides online help for each of its configuration displays. Parameter descriptions provided in this manual for front panel configuration can also be used when configuring the indicator using Revolution: the interface is different, but the parameters set are the same.

#### 3.1.2 EDP Command Configuration

The EDP command set can be used to configure the IQ plus 590-DC indicator using a personal computer, terminal, or remote keyboard. Like Revolution, EDP command configuration sends commands to the indicator EDP port; unlike Revolution, EDP commands can be sent using any external device capable of sending ASCII characters over a serial connection.

EDP commands duplicate the functions available using the indicator front panel and provide some functions not otherwise available. EDP commands can be used to simulate pressing front panel keys, to configure the indicator, or to dump lists of parameter settings. See Section 5.0 on page 25 for more information about using the EDP command set.

#### 3.1.3 Front Panel Configuration

The IQ plus 590-DC indicator can be configured using a series of menus accessed through the indicator front panel when the indicator is in setup mode. Table 3-1 summarizes the functions of each of the main menus.

	Menu	Menu Function
CONFIG	Configuration	Configure grads, zero tracking, zero range, motion band, overload, tare function, sample rate, and digital filtering parameters.
FORMAT	Format	Set format of primary and secondary units, display rate.
CALIBR	Calibration	Calibrate indicator. See Section 4.0 on page 23 for calibration procedures.
SERIAL	Serial	Configure serial port.
PROGRM	Program	Set power-up and standby modes, counting scale functions, regulatory mode, unit ID and consecutive number values.
P FORMT	Print Format	Set print format used for gross, net, and counting scale tickets. See Section 7.0 on page 31 for more information.
VERSION	Version	Display installed software version number.

Table 3-1. IQ plus 590-DC Menu Summary

## SETUP MODE KEY FUNCTIONS

Figure 3-2. Front Panel Key Functions in Setup Mode

Four front panel keys are used as directional keys to navigate through the menus in setup mode (see Figure 3-2). The UNITS  $(\triangleleft)$  and PRINT  $(\triangleright)$  keys scroll left and right (horizontally) on the same menu level; ZERO  $(\triangle)$  and GROSS/NET  $(\nabla)$  move up and down (vertically) to different menu levels. The **TARE** key  $(\bigcirc)$  serves as an Enter key for selecting parameter values within the menus. A label over each of these keys identifies the direction provided by the key when navigating through the setup menus.

Figure 3-3. Setup Mode Menu Navigation

To select a parameter, press  $\triangleleft$  or  $\triangleright$  to scroll left or right until the desired menu group appears on the display, then press  $\triangledown$  to move down to the submenu or parameter you want. When moving through the menu parameters, the default or previously selected value appears first on the display.

To change a parameter value, scroll left or right to view the values for that parameter. When the desired value appears on the display, press  $\bigcirc$  to select the value and move back up one level. To edit numeric values, use the numeric keypad on the indicator front panel.

## 3.2 Menu Structures and Parameter Descriptions

The following sections provide graphic representations of the IQ plus 590-DC menu structures. In the actual menu structure, the settings you choose under each parameter are arranged horizontally. To save page space, menu choices are shown in vertical columns. The factory default setting appears at the top of each column.

Most menu diagrams are accompanied by a table that describes all parameters and parameter values associated with that menu. Default parameter values are shown in bold type.

**NOTE:** Some characters cannot be accurately represented on the 7-segment front panel LCD display. Section 8.4 on page 37 lists the 7-segment character set and the alphanumerics they represent.

## 3.2.1 Configuration Menu

Figure 3-4. Configuration Menu

CONFIG Menu			
Parameter	Choices	Description	
Level 2 submenus			
GRADS	10000 number	Graduations. Specifies the number of full scale graduations. The value entered must be in the range 1–999 999 and should be consistent with legal requirements and environmental limits on system resolution.	
		To calculate GRADS, use the formula, GRADS = Capacity / Display Divisions.	
		Display divisions for primary and secondary units are specified on the FORMAT menu.	
ZTRKBN	OFF 0.5D 1D 3D	Zero track band. Automatically zeroes the scale when within the range specified, as long as the input is within the ZRANGE and scale is at standstill. Selections are ± display divisions. Maximum legal value varies depending on local regulations.	
ZRANGE	<b>1.9%</b> 100%	Zero range. Selects the range within which the scale can be zeroed. The 1.9% selection is $\pm$ 1.9% around the calibrated zero point, for a total range of 3.8%. Indicator must be at standstill to zero the scale. Use 1.9% for legal-for-trade applications.	

Table 3-2. Configuration Menu Parameters

CONFIG Menu		
Parameter	Choices	Description
MOTBAN	1D 2D 3D 5D 10D 20D OFF	Motion band. Sets the level, in display divisions, at which scale motion is detected. If motion is not detected for 1 second or more, the standstill symbol lights. Some operations, including print, tare, and zero, require the scale to be at standstill. Maximum legal value varies depending on local regulations.  If OFF is selected, ZTRKBN should also be set to OFF.
OVRLOA	FS+2% FS+1D FS+9D FS	Overload. Determines the point at which the display blanks and an out-of-range error message is displayed. Maximum legal value varies depending on local regulations.
SMPRAT	15HZ 30HZ 3.75HZ 7.5HZ	Sample rate. Selects measurement rate, in samples per second, of the analog-to-digital converter. Lower sample rate values provide greater signal noise immunity.
DIGFL1 DIGFL2 DIGFL3	4 8 16 32 64 128 1 2	Digital filtering. Selects the digital filtering rate used to reduce the effects of mechanical vibration from the immediate area of the scale.  Choices indicate the number of A/D conversions that are averaged to obtain the displayed reading. A higher number gives a more accurate display by minimizing the effect of a few noisy readings, but slows down the settling rate of the indicator. See Section 8.6 on page 39 for more information on digital filtering.
DFSENS	80UT 16OUT 32OUT 64OUT 128OUT 2OUT 4OUT	Digital filter cutout sensitivity. Specifies the number of consecutive readings that must fall outside the filter threshold (DFTHRH parameter) before digital filtering is suspended.
DFTHRH	NONE 2DD 5DD 10DD 20DD 50DD 100DD 200DD 250DD	Digital filter cutout threshold. Specifies the filter threshold, in display divisions. When a specified number of consecutive scale readings (DFSENS parameter) fall outside of this threshold, digital filtering is suspended. If NONE is selected, the filter is always enabled.
TAREFN	BOTH NOTARE PBTARE KEYED	Tare function. Enables or disables pushbutton and keyed tares. Possible values are:  BOTH: Both pushbutton and keyed tares enabled  NOTARE: No tare allowed (gross mode only)  PBTARE: Pushbutton tares enabled  KEYED: Keyed tare enabled

Table 3-2. Configuration Menu Parameters (Continued)

#### 3.2.2 Format Menu

Figure 3-5. Format Menu

FORMAT Menu	FORMAT Menu			
Parameter	Choices	Description		
Level 2 submenus				
PRIMAR	DECPNT DSPDIV UNITS	Specifies the decimal position, display divisions, and units used for the primary units. See Level 3 submenu parameter descriptions.		
SECNDR	DECPNT DSPDIV UNITS MULT	Specifies the decimal position, display divisions, units, and conversion multiplier used for the secondary units. See Level 3 submenu parameter descriptions.		
DSPRAT	250MS 500MS 750MS 1500MS 2500MS 1SEC 2SEC 3SEC 4SEC 6SEC 8SEC	Display rate. Sets the update rate for displayed values. Values are in milliseconds (MS) or seconds (SEC).		

Table 3-3. Format Menu Parameters

FORMAT Menu			
Parameter	Choices	Description	
Level 3 submenus			
Primary Units (PRI	MAR Paramete	r)	
DECPNT	88888 888880 8.88888 88.8888 888.888 8888.88 8888.88	Decimal point location. Specifies the location of the decimal point or dummy zeroes in the primary unit display. Value should be consistent with local legal requirements.	
DSPDIV	1D 2D 5D	Display divisions. Selects the minimum division size for the primary units displayed weight.	
UNITS	LB KG	Specifies primary units for displayed and printed weight. Values are: LB=pound; KG=kilogram; OZ=ounce; TN=short ton; T=metric ton; G=gram.	
	OZ TN T G NONE	<b>NOTE</b> : Indicators sold outside North America are configured with <b>KG</b> for both primary and secondary units.	
Secondary Units (	SECNDR Param	neter)	
DECPNT	88888.8 888888 888880 8.88888 88.8888 888.888 888.888	Decimal point location. Determines the location of the decimal point or dummy zeros in the secondary unit display.	
DSPDIV	<b>5D</b> 1D 2D	Display divisions. Selects the value of minimum division size of the displayed weight.	
UNITS	KG OZ TN T G LB NONE	Specifies secondary units for displayed and printed weight. Values are: KG=kilogram; OZ=ounce; TN=short ton; T=metric ton; G=gram; LB=pound.	
MULT	0.45359 Enter other choices via keyboard	Multiplier. Specifies the conversion factor by which the primary units are multiplied to obtain the secondary units. The default is 0.45359, which is the conversion factor for changing pounds to kilograms. See Section 8.5 on page 38 for a list of multipliers.  To toggle between primary and secondary units, press the UNITS key.

## 3.2.3 Calibration Menu

See Section 4.0 on page 23 for calibration procedures.

Figure 3-6. Calibration Menu

CALIBR Menu			
Parameter	Parameter Choices Description		
Level 2 subme	enus		
WZERO	_	Calibrate zero, display and edit the zero calibration A/D count value.	
WVAL	_	Display and edit the test weight value.	
WSPAN	_	Calibrate span, display and edit the span calibration A/D count value.	
REZERO	_	Press Enter to remove an offset value from the zero and span calibrations.  Use this parameter only after WZERO and WSPAN have been set. See Section 4.1 on page 23 for more information about using this parameter.	

Table 3-4. Calibration Menu Parameters

#### 3.2.4 Serial Menu

See Section 8.2 on page 34 for information about the IQ plus 590-DC serial data format.

Figure 3-7. Serial Menu

SERIAL Menu	SERIAL Menu		
Parameter	Choices	Description	
Level 2 Subme	enus		
BAUD	9600 19200 300 600 1200 2400 4800	Baud rate. Selects the transmission speed for the EDP port.	
BITS	8NONE 7EVEN 7ODD	Selects number of data bits and parity of data transmitted from the EDP port.	
TERMIN	CR/LF CR	Termination character. Selects termination character for data sent from the EDP port.	
EOLDLY	0 number	End-of-line delay. Sets the delay period, in 0.1-second intervals, from when a formatted line is terminated to the beginning of the next formatted serial output. Value specified must be in the range 0-255, in tenths of a second (10 = 1 second).	
STREAM	OFF LFT INDUST	Selects whether continuous data output is streamed from the serial port. Select LFT for legal-for-trade applications in which the streamed data must match the current displayed weight. Select INDUST to stream the latest weight data, regardless of the value displayed.  See Section 8.2 on page 34 for information about the IQ plus 590-DC continuous data format.	

Table 3-5. Serial Menu Parameters

## 3.2.5 Program Menu

Figure 3-8. ProgramMenu

PROGRM Menu			
Parameter	Choices	Description	
Level 2 subme	enus		
PWRUPM	GO DELAY	Power up mode. In GO mode, the indicator goes into operation immediately after a brief power up display test.	
		In DELAY mode, the indicator performs a power up display test, then enters a 30-second warm up period. If no motion is detected during the warm up period, the indicator becomes operational when the warm up period ends; if motion is detected, the delay timer is reset and the warm up period repeated.	
STNDBY	SBYDLY LSTMOD	Specifies standby mode delay and whether indicator returns to the last operating mode or performs a power-up sequence when standby mode ends. See Level 3 submenu parameter descriptions.	
COUNT	ACCESS SPLSIZ	Specifies whether operator has access to piece count mode and the default sample size used for parts counting. See Level 3 submenu parameter descriptions.	

Table 3-6. Program Menu Parameters

PROGRM Menu	PROGRM Menu			
Parameter	Choices	Description		
REGULA NONE		Regulatory mode. Specifies the regulatory agency having jurisdiction over the scale site.		
	OIML NTEP CANADA	<ul> <li>OIML, NTEP, and CANADA modes allow a tare to be acquired at any weight greater than zero. NONE allows tares to be acquired at any weight value.</li> <li>OIML, NTEP, and CANADA modes allow a tare to be cleared only if the gross weight is at no load. NONE allows tares to be cleared at any weight value.</li> </ul>		
		<ul> <li>NTEP and OIML modes allow a new tare to be acquired even if a tare is already present.</li> <li>In CANADA mode, the previous tare must be cleared before a new tare can be acquired.</li> </ul>		
		<ul> <li>NONE, NTEP and CANADA modes allow the scale to be zeroed in either gross or net mode as long as the current weight is within the specified ZRANGE. In OIML mode, the scale must be in gross mode before it can be zeroed; pressing the ZERO key in net mode clears the tare.</li> </ul>		
CONSNU	000000 number	Consecutive numbering. Allows sequential numbering for print operations. The consecutive number value is incremented following each print operation.		
		The initial value of this parameter is set to the start up value specified on the CONSTU parameter. Changing either CONSTU or CONSNU immediately resets the consecutive number used for printing.		
CONSTU	000000 number	Consecutive number start up value. Specifies the initial consecutive number (CONSNU) value used when the indicator is powered on.		
UID	1 number	Unit ID. Specify a unit identifier for the indicator in the range 1–999999. The unit ID can be added to print ticket formats to identify the indicator used to generate the ticket.		
Level 3 subme	enus			
SBYDLY	0 number	Standby mode delay. Specifies the number of minutes the indicator must be inactive before entering standby mode. Valid values are 0 (off) or 1–120 minutes.		
		The indicator enters standby mode if no key presses, serial communications, or scale motion occur for the length of time specified on this parameter. Set this parameter to 0 to disable standby mode.		
LSTMOD	YES NO	Last mode. Specifies whether the indicator resumes operation in the last mode it was in before entering standby mode (YES) or performs the standard power-up sequence (NO).		
ACCESS	<b>DSABLE</b> ENABLE	Operator access to piece count mode. Specify DSABLE if piece count mode will not be used. With access disabled, pressing the GROSS/NET (MODE) key toggles between gross and net modes only.		
SPLSIZ	10 20 50 100 5	Sample size. Specify the default sample size used for counting scale operations. Sample size can be changed in counting mode during sample acquisition.		

Table 3-6. Program Menu Parameters (Continued)

#### 3.2.6 Print Format Menu

See Section 7.0 on page 31 for information about custom print formatting.

Figure 3-9. Print Format Menu

#### 3.2.7 Version Menu

The VERS menu is used to check the software version installed in the indicator. There are no parameters associated with the Version menu: when selected, the indicator displays the installed software version number.

Figure 3-10. Version Menu

## 4.0 Calibration

The IQ plus 590-DC can be calibrated using the front panel, EDP commands, or the Revolution<sup>™</sup> Scaleware configuration utility. Each method consists of the following steps:

- Zero calibration
- Entering the test weight value
- Span calibration
- Optional rezero calibration for test weights using hooks or chains.

The following sections describe the calibration procedure for each of the calibration methods.

Figure 4-1. Calibration (CALIBR) Menu

#### 4.1 Front Panel Calibration

To calibrate the indicator using the front panel, do the following:

- 1. Place the indicator in setup mode (display reads *CONFIG*) and remove all weight from the scale platform. If your test weights require hooks or chains, place the hooks or chains on the scale for zero calibration.
- 2. Press 

  until the display reads CALIBR (see Figure 4-1). Press 

  to go to zero calibration (WZERO).
- 3. With *WZERO* displayed, press to calibrate zero. The indicator displays \*CAL\* while calibration is in progress. When complete, the A/D count for the zero calibration is displayed. Press again to save the zero calibration value and go to the next prompt (*WVAL*).
- 4. With WVAL displayed, place test weights on the scale and press to show the test weight value. Use the numeric keypad to enter the actual test weight, then press to save the value and go to span calibration (WSPAN).
- 5. With WSPAN displayed, press to calibrate span. The indicator displays \*CAL\* while calibration is in progress. When complete, the A/D count for the span calibration is displayed. Press again to save the span calibration value and go to the next prompt (REZERO).
- 6. The rezero function is used to remove a calibration offset when hooks or chains are used to hang the test weights.

- If hooks or chains were used during calibration, remove these and the test weights from the scale. With all weight removed, press to rezero the scale. This function adjusts the zero and span calibration values. The indicator displays \*CAL\* while the zero and span calibrations are adjusted. When complete, the adjusted A/D count for the zero calibration is displayed. Press to enter the value, then press △ to return to the CALIBR menu.
- 7. Press  $\triangleleft$  until the display reads *CONFIG*, then press  $\triangle$  to exit setup mode.

#### 4.2 EDP Command Calibration

To calibrate the indicator using EDP commands, the indicator EDP port must be connected to a terminal or personal computer. See Section 2.3.3 on page 6 for EDP port pin assignments; see Section 5.0 on page 25 for more information about using EDP commands.

Once the indicator is connected to the sending device, do the following:

1. Place the indicator in setup mode (display reads *CONFIG*) and remove all weight from the scale platform. If your test weights require hooks or chains, place the hooks or chains on the scale for zero calibration.

- 2. Send the WZERO EDP command to calibrate zero. The indicator displays \*CAL\* while calibration is in progress.
- Place test weights on the scale and use the WVAL command to enter the test weight value in the following format:
   WVAL=nnnnnn<CR>
- 4. Send the WSPAN EDP command to calibrate span. The indicator displays \*CAL\* while

- calibration is in progress.
- 5. To remove an offset value, clear all weight from the scale, including hooks or chains used to hang test weights, then send the REZERO EDP command. The indicator displays \*CAL\* while the zero and span calibrations are adjusted.
- 6. Send the KUPARROW EDP command to exit setup mode.

### 4.3 Revolution™ Scaleware Calibration

To calibrate the indicator using Revolution Scaleware, the indicator EDP port must be connected to a PC running the Revolution configuration utility.

Use the following procedure to calibrate the indicator:

- 1. Place the indicator in setup mode (display reads *CONF/G*) and remove all weight from the scale platform.
- 2. Select *Calibrate Indicator* from the Revolution Scaleware main menu.
- 3. On the Indicator Calibration display, select the indicator model (IQ+590-DC) and communications port, then click OK.
- 4. Revolution Scaleware uploads calibration data from the indicator then presents the information in a display like that shown in Figure 4-2.

Figure 4-2. Revolution Scaleware Calibration Display

- 5. Enter the *Value of Test Weight* to be used for span calibration then click *OK*.
- 6. The Zero Calibration dialog box prompts you to remove all weight from the scale. Clear the scale and click OK to begin zero calibration. NOTE: If your test weights require hooks or chains, place the hooks or chains on the scale for zero calibration.
- 7. When zero calibration is complete, the Span Calibration dialog box prompts you to place test weights on the scale for span calibration. Place tests weights on the scale then click *OK*.
- 8. When span calibration is complete, the Rezero dialog box prompts you to remove weights from the scale. Remove the weights then click *OK*.
- 9. When calibration is complete, the *New Settings* fields of the Indicator Calibration display are filled in. Click *Exit* to save the new values and return to the Revolution Scaleware main menu; to restore the previous calibration values, click *Restore Settings*.

## 5.0 EDP Commands

The IQ plus 590-DC indicator can be controlled by a personal computer or remote keyboard connected to the indicator EDP port. Control is provided by a set of EDP commands that can simulate front panel key press functions, display and change setup parameters, and perform reporting functions. The EDP port provides the capability to print configuration data or to save that data to an attached personal computer. This section describes the EDP command set and procedures for saving and transferring data using the EDP port.

### 5.1 The EDP Command Set

The EDP command set can be divided into five groups: key press commands, reporting commands, the RESETCONFIGURATION special function command, parameter setting commands, and transmit weight data commands.

When the indicator processes an EDP command, it responds with the message *OK*. The *OK* response verifies that the command was received and has been executed. If the command is unrecognized or cannot be executed, the indicator responds with ??.

The following sections list the commands and command syntax used for each of these groups.

#### 5.1.1 Key Press Commands

Key press EDP commands (see Table 5-1) simulate pressing the keys on the front panel of the indicator. These commands can be used in both setup and weighing mode. Several of the commands serve as "pseudo" keys, providing functions that are not represented by a key on the front panel.

For example, to enter a 15-pound tare weight using EDP commands:

- 1. Type K1 and press ENTER (or RETURN).
- 2. Type K5 and press ENTER.
- 3. Type KTARE and press ENTER.

The indicator displays the 🕏 symbol when a tare has been entered and shifts the display to net mode.

Command	Function
KZERO	Press the ZERO key
KGROSSNET	Press the GROSS/NET key
KGROSS	Go to gross mode (pseudo key)
KNET	Go to net mode (pseudo key)
KCOUNT	Go to piece count mode (pseudo key)
KTARE	Press the TARE key
KUNITS	Press the UNITS key
KPRIM	Go to primary units (pseudo key)
KSEC	Go to secondary units (pseudo key)
KPRINT	Press the PRINT key
KDISPTARE	Press the DISPLAY TARE key
KCLR	Press the CLEAR key
KLEFTARROW	In setup mode, move left in the menu
KRIGHTARROW	In setup mode, move right in the menu
KUPARROW	In setup mode, move up in the menu
KDOWNARROW	In setup mode, move down in the menu
K0	Press number 0 (zero)
K1	Press number 1
K2	Press number 2
K3	Press number 3
K4	Press number 4
K5	Press number 5
K6	Press number 6
K7	Press number 7
K8	Press number 8
K9	Press number 9
KDOT	Press the decimal point (.)
KENTER	Press the ENTER key

Table 5-1. Key Press EDP Commands

#### 5.1.2 Reporting Commands

Reporting commands (see Table 5-2) send specific information to the EDP port. These commands can be used in both setup mode and normal mode.

Command	Function
DUMPALL	List all parameter values
VERSION	Write IQ plus 590-DC software version
RS	Reset the indicator
P	Write current displayed weight with units identifier.  The P command returns the current displayed weight value to the EDP port, along with the units identifier. If the indicator is in an underrange or overload condition, the weight value is replaced with ##### (overload) or %%%%%% (underrange).
S	Write one frame of stream format

Table 5-2. EDP Reporting Commands

#### 5.1.3 The RESETCONFIGURATION Command

The RESETCONFIGURATION command can be used to restore all configuration parameters to their default values. Before issuing this command, the indicator must be placed in setup mode or test mode (press and hold setup switch for approximately four seconds to enter test mode).

Sending this command, followed by the RS (RESET) EDP command, is equivalent to using the DEFLT function on the TEST menu. See Section 8.7 on page 40 for more information about test mode and using the TEST menu. **NOTE**: All load cell calibration settings are lost when the RESETCONFIGURATION command is run.

#### 5.1.4 Parameter Setting Commands

Parameter setting commands allow you to display or change the current value for a particular configuration parameter (Tables 5-3 through Table 5-8).

Current configuration parameter settings can be displayed in either setup mode or normal mode using the following syntax:

command<ENTER>

Most parameter values can be changed in setup mode only. Use the following command syntax when changing parameter values:

command=value<ENTER>

where *value* is either a number or a parameter value. Use no spaces before or after the equal (=) sign. If you type an incorrect command, the display reads ??. Changes to the parameters do not take effect until you exit setup mode.

For example, to set the motion band parameter to 5, type the following:

MOTBAND=5D<ENTER>

Command	Description	Values
GRADS	Graduations	1–999 999
ZTRKBND	Zero track band	OFF, 0.5D, 1D, 3D
ZRANGE	Zero range	1.9%, 100%
MOTBAND	Motion band	1D, 2D, 3D, 5D, 10D, 20D, OFF
OVRLOAD	Overload	FS+2%, FS+1D, FS+9D, FS
SMPRAT	Sample rate	15HZ, 30HZ, 3.75HZ, 7.5HZ
DIGFLTR1 DIGFLTR2 DIGFLTR3	Digital filtering	1, 2, 4, 8, 16, 32, 64
DFSENS	Digital filter cutout sensitivity	20UT, 40UT, 80UT, 160UT, 320UT, 640UT, 1280UT
DFTHRH	Digital filter cutout threshold	NONE, 2DD, 5DD, 10DD, 20DD, 50DD, 100DD, 200DD, 250DD
TAREFN	Tare function	BOTH, NOTARE, PBTARE, KEYED

Table 5-3. CONFIG EDP Commands

Command	Description	Values
PRI.DECPNT	Primary units decimal position	8.88888, 88.8888, 888.888, 8888.88, 88888.8, 888888, 888880
PRI.DSPDIV	Primary units display divisions	1D, 2D, 5D
PRI.UNITS	Primary units	LB, KG, OZ, TN, T, G, NONE
SEC.DECPNT	Secondary units decimal position	8.88888, 88.8888, 888.888, 8888.88, 88888.8, 888888, 888880
SEC.DSPDIV	Secondary units display divisions	1D, 2D, 5D
SEC.UNITS	Secondary units	LB, KG, OZ, TN, T, G, NONE
SEC.MULT	Secondary units multiplier	0.00000–999999
DSPRATE	Display rate	250MS, 500MS, 750MS, 1500MS, 2500MS, 1SEC, 2SEC, 3SEC, 4SEC, 6SEC, 8SEC

Table 5-4. FORMAT EDP Commands

Command	Description	Values
WZERO	Zero calibration	_
WVAL	Test weight value	test_weight_value
WSPAN	Span calibration	_
REZERO	Rezero	_
LC.CD	Set deadload coefficient	value
LC.CW	Set span coefficient	value

Table 5-5. CALIBR EDP Commands

Command	Description	Values
EDP.BAUD	Baud rate	300, 600, 1200, 2400, 4800, 9600, 19200
EDP.BITS	Data bits/parity	8NONE, 7EVEN, 7ODD
EDP.TERMIN	Termination character	CR/LF, CR
EDP.EOLDLY	End-of-line delay	0–255 (0.1-second intervals)
EDP.STREAM	Stream format	OFF, LFT, INDUST

Table 5-6. SERIAL EDP Commands

Command	Description	Values
PWRUPMD	Power up mode	GO, DELAY
SBYDLY	Standby delay	0–120
LSTMOD	Last mode	YES, NO
CNTMOD	Counting mode	ENABLE, DSABLE
SAMPSIZ	Default sample size	5, 10, 20, 50, 100
REGULAT	Regulatory compliance	NONE, OIML, NTEP, CANADA
CONSNUM	Consecutive number	0–999 999
CONSTUP	Consecutive number start-up value	0–999 999
UID	Unit identifier	0–999 999

Table 5-7. PROGRM EDP Commands

Command	Description	Values
GFMT	Gross demand print format string	See Section 7.0 on page 31 for detailed information
NFMT	Net demand print format string	
CFMT	Counting mode print format string	

Table 5-8. PFORMT EDP Commands

#### 5.1.5 Normal Mode Commands

The serial transmit weight data commands (see Table 5-9) transmit data to the EDP port on demand. The transmit weight data commands are valid only in normal operating mode.

Command	Description	Response Format
SX	Start EDP streaming	OK or??
EX	Stop EDP streaming	OK or??
XG	Transmit gross weight in displayed units	nnnnn UU
XN	Transmit net weight in displayed units	where <i>nnnnnn</i> is the weight value, <i>UU</i> is the units.
XT	Transmit tare weight in displayed units	
XG2	Transmit gross weight in non-displayed units	
XN2	Transmit net weight in non-displayed units	
XT2	Transmit tare weight in non-displayed units	
XC	Transmit current part count	nnnnn
XW	Transmit current piece weight	nnnnn

Table 5-9. Normal Mode EDP Commands

## 5.2 Saving and Transferring Data

Connecting a personal computer to the IQ plus 590-DC EDP port allows you to save indicator configuration data to the PC or to download configuration data from the PC to an indicator. The following sections describe the procedures for these save and transfer operations.

#### 5.2.1 Saving Indicator Data to a Personal Computer

Configuration data can be saved to a personal computer connected to the EDP port. The PC must be running a communications program such as PROCOMMPLUS<sup>®</sup>. See Section 2.3.3 on page 6 for information about serial communications wiring and EDP port pin assignments.

When configuring the indicator, ensure that the values set for the BAUD and BITS parameters on the SERIAL menu match the baud rate, bits, and parity settings configured for the serial port on the PC.

To save all configuration data, place the indicator in setup mode and send the DUMPALL EDP command to the indicator. The IQ plus 590-DC responds by sending all configuration parameters to the PC as ASCII-formatted text.

# 5.2.2 Downloading Configuration Data from PC to Indicator

Configuration data saved on a PC or floppy disk can be downloaded from the PC to an indicator. This procedure is useful when a number of indicators with similar configurations are set up or when an indicator is replaced.

To download configuration data, connect the PC to the EDP port as described in Section 5.2.1. Place the indicator in setup mode and use the PC communications software to send the saved configuration data to the indicator. When transfer is complete, calibrate the indicator as described in Section 4.0 on page 23.

#### NOTES:

- Calibration settings are included in the configuration data downloaded to the indicator. If the receiving indicator is a direct replacement for another IQ plus 590-DC and the attached scale is not changed, recalibration is not required.
- When downloading configurations that include changed serial communications settings, edit the data file to place the serial communications changes at the end of the file. Communication between the PC and indicator will be lost once the indicator receives settings for baud rate (BAUD parameter) or data bits and parity (BITS parameter) that do not match those configured for the PC.

# 6.0 Counting Operations

The IQ plus 590-DC provides a piece count mode that allows the indicator to serve as a portable counting scale. In piece count mode, the indicator display shows the number of parts on the scale rather than the weight of those parts.

**NOTE:** Legal-for-trade applications require product to be sold by weight rather than an equivalent parts count. Operator access to piece count mode is disabled when the indicator is shipped from the factory.

To enable operator access to piece count mode, set the ACCESS parameter to ENABLE (COUNT submenu on the PROGRM menu) or send the CNTMOD= ENABLE EDP command.

Piece count mode has two submodes:

- Count display mode displays the current parts count and allows ticket printing using the CFMT print format.
- Sample acquisition mode is used to calibrate the indicator for parts counting.

#### **Count Display Mode**

Piece count mode is entered by pressing the MODE (GROSS/NET) key from normal weighing mode. In count display mode, the display shows the number of parts rather than weight, the arrow annunciator at the right side of the LCD display points to piece count (PC), and pressing the PRINT key sends the CFMT print format data string to the serial port (see Figure 6-1 on page 30).

If a sample weight has not yet been acquired, the indicator switches automatically to sample acquisition mode, described below.

#### **Sample Acquisition Mode**

Sample acquisition mode is used to select the sample quantity and calibrate the indicator for the parts being counted.

To set a new sample weight, do the following:

- 1. Place empty parts container on scale. Wait for standstill, then press TARE to acquire the tare weight of the container.
- 2. Press MODE to enter piece count mode.
- 3. From count display mode, press the SAMPLE (UNITS) key to enter sample acquisition mode.
- 4. The indicator display shows the message *Addnnn*, where *nnn* is the sample quantity to be placed on the scale. You can do one of the following:

- Add the number of parts shown.
- Choose a different sample size. Press the SAMPLE key to scroll through the selectable sample quantities (5, 10, 20, 50, 100) or use the numeric keypad to specify a custom sample size.
- Specify a known piece weight. Press the SAMPLE key to scroll through the selectable sample quantities until the PC WGT prompt is shown. Use the numeric keypad to enter the piece weight.
- 5. Once the sample quantity is on the scale, press ENTER to calibrate the indicator for counting the new parts. If a sample size was specified, the indicator display shows the message -CNT- as it acquires the sample weight, then switches to count display mode and shows the part quantity. If a known piece weight was specified, the display switches to count display mode immediately.

If the weight of the sample quantity is insufficient for piece counting, the indicator automatically requests the next higher sample quantity by showing the *Addnnn* message again. If the sample quantity is at maximum (100) and the sample weight is still not sufficient, the indicator shows the message *CNTERR*.

To view gross and net weight of parts, press MODE to switch from count display mode to normal weighing mode. To view the current piece weight while in count mode, press the DISPLAY TARE key.

## **COUNTING MODE KEY FUNCTIONS**

Figure 6-1. Front Panel Key Functions in Piece Count Mode

# 7.0 Print Formatting

The IQ plus 590-DC provides three print formats, GFMT, NFMT, and CFMT that determine the format of the printed output when the PRINT key is pressed or when a KPRINT EDP command is received. If no tare has been entered, the GFMT print format is used; if a tare has been entered, NFMT is used; in counting mode, CFMT is used.

Each print format can be customized to include up to 300 characters of information, such as company name and address, on printed tickets. You can use the indicator front panel (PFORMT menu), EDP commands, or the Revolution™ Scaleware configuration utility to customize the print formats.

## 7.1 Print Formatting Commands

Table 7-1 lists commands you can use to format the gross and net print formats. Commands included in the format strings must be enclosed between < and > delimiters. Any characters outside of the delimiters are printed as text on the ticket. Text characters can include any ASCII character that can be printed by the output device.

Command	Description
<g></g>	Gross weight in displayed units
<g2></g2>	Gross weight in non-displayed units
<n></n>	Net weight in displayed units
<n2></n2>	Net weight in non-displayed units
<t></t>	Tare weight in displayed units
<t2></t2>	Tare weight in non-displayed units
<c></c>	Current piece count
<w></w>	Current piece weight
<id></id>	Unit identifier
<cn></cn>	Consecutive number
<nlnn></nlnn>	New line (nn = number of termination [ <cr lf=""> or <cr>] characters)*</cr></cr>
<spnn></spnn>	Space (nn = number of spaces)*
<su></su>	Toggle weight data format (formatted/unformatted)**

Gross, net, and tare weights are 10 digits in length, including sign, followed by a space and a two-digit units identifier. Total field length with units identifier is 13 characters.

ID and consecutive number (CN) fields are 1–6 characters in length, as required.

\* If *nn* is not specified, 1 is assumed. Value must be in the range 1–99.

Table 7-1. Print Format Commands

Command Description						
** After receiving an SU command, the indicator sends						
unformatted data until the next SU command is received.						
Unformatted data omits decimal points, leading and trailing						

Table 7-1. Print Format Commands (Continued)

The default GFMT and NFMT print formats use only the new line (<NL>) command and the commands for gross, net, and tare weights in displayed units (<G>, <N>, and <T>).

The default IQ plus 590-DC print formats are shown in Table 7-2:

	Format	Default Format String	Sample Output
Ī	GFMT	<g> GROSS<nl></nl></g>	2046.81 lb GROSS
	NFMT	<g> GROSS<nl> <t> TARE<nl> <n> NET<nl></nl></n></nl></t></nl></g>	4053.1 lb GROSS 15.6 lb TARE 4037.5 lb NET
İ	CFMT	<c><nl></nl></c>	512 PC

NOTE: In OIML and CANADA modes, the letters *PT* (preset tare) are automatically inserted after the printed tare weight.

Table 7-2. Default Print Formats

#### NOTES:

characters.

- The <G2>, <N2>, and <T2> commands listed in Table 7-1 print the gross, net, and tare weights in non-displayed units—that is, in the units *not* currently displayed on the indicator.
- ID numbers included in the print format string (<ID> command) must be set using the UID EDP command.
- The 300-character limit of each print format string includes the output field length of the print formatting commands, not the command length. For example, if the indicator is configured to show a decimal point, the <G> command generates an output field of 13 characters: the 10-character weight value (including decimal point), one space, and a two-digit units identifier.

## 7.2 Customizing Print Formats

The following sections describe procedures for customizing the GFMT, NFMT, and CFMT formats using the EDP port, the front panel (PFORMT menu), and the Revolution Scaleware configuration utility.

#### 7.2.1 Using the EDP Port

With a personal computer, terminal, or remote keyboard attached to the IQ plus 590-DC EDP port, you can use the EDP command set to customize the print format strings.

To view the current setting of a format string, type the name of the string (GFMT, NFMT, or CFMT) and press ENTER. For example, to check the current configuration of the GFMT format, type GFMT and press ENTER. The indicator responds by sending the current configuration for the gross format:

GFMT=<G> GROSS<NL>

To change the format, use the GFMT, NFMT, or CFMT EDP command followed by an equals sign (=) and the modified print format string. For example, to add the name and address of a company to the gross format, you could send the following EDP command:

GFMT=MLC SHIPPING<NL>1357 WEST HOWARD ROAD<NL>BIGTOWN<NL2><G> GROSS<NL>

A ticket printed using this format might look like the following:

MLC SHIPPING 1357 WEST HOWARD ROAD BIGTOWN

27862 LB GROSS

#### 7.2.2 Using the Front Panel

If you have no access to equipment for communication through the EDP port or are working at a site where such equipment cannot be used, you can use the PFORMT menu (see Figure 7-1) to customize the print formats.

Using the PFORMT menu, you can edit the print format strings by changing the decimal values of the ASCII characters in the format string.

**NOTE:** Lower-case letters and some special characters cannot be displayed on the IQ plus 590-DC front panel (see the ASCII character chart on page 35) and are shown as blanks. The IQ plus 590-DC can send or receive any ASCII character; the character printed depends on the particular ASCII character set implemented for the receiving device.

Figure 7-1. PFORMT Menu, Showing Alphanumeric Character Entry Procedure

#### 7.2.3 Using Revolution Scaleware

The Revolution Scaleware configuration utility provides a print formatting grid with a tool bar. The grid allows you to construct the print format without the formatting commands (<NL> and <SP>) required by the front panel or EDP command methods. Using Revolution, you can type text directly into the grid, then select weight value fields from the tool bar and place them where you want them to appear on the printed ticket.

Figure 7-2 shows an example of the Revolution Scaleware print formatting grid.

Figure 7-2. Revolution Scaleware Print Format Grid

# 8.0 Appendix

# 8.1 Error Messages

The IQ plus 590-DC provides a number of front panel error messages to assist in problem diagnosis. Table 8-1 lists these messages and their meanings.

Error Message	Description	Solution
ADCERR	A/D not responding	Call Rice Lake Weighing Systems (RLWS) Service.
ADCKSM	A/D coefficient checksum error	
CFCKSM	Configuration checksum error	Use TEST menu to perform DEFLT (restore defaults) procedure, then recalibrate load cells.
CNTERR	Count error; insufficient sample size	Use larger parts sample.
DSPERR	Display error	Call RLWS Service.
EEPERR	EEPROM write error	
LCCKSM	Load cell calibration checksum error	Recalibrate load cells.
LCPERR	Load cell power failed	Replace batteries. If error still shown, call RLWS Service.
OVERFL	Overflow error	Weight value too large (> 999999) to be displayed. Check configuration.
PFCKSM	Print format checksum error	Check print formats for errors.
RAMERR	RAM test failed	Call RLWS Service.
TARERR	EEPROM read error	Use TEST menu to perform DEFLT (restore defaults) procedure, then recalibrate load cells.
VIREE	EEPROM error	Use TEST menu to perform DEFLT (restore defaults) procedure, then recalibrate load cells and reconfigure indicator.
	Overrange error	Gross value exceeds overload limit. Check configuration.
	A/D underrange	Weight value too small (< -99999) to be displayed or A/D reading < -2.5 mV. Check load cell input signal.
STNDBY	Standby mode	Press any key to return to operating mode.

Table 8-1. IQ plus 590-DC Error Messages

## 8.2 Continuous Output (Stream) Format

Figure 8-1 shows the continuous output format sent to the IQ plus 590-DC serial port when the STREAM parameter (SERIAL menu) is set to either LFT or INDUST.

Figure 8-1. Continuous Output Data Format

## 8.3 ASCII Character Chart

Use the decimal values for ASCII characters listed in Tables 8-2 and 8-3 when specifying print format strings on the IQ plus 590-DC PFORMT menu. The actual character printed depends on the character mapping used by the output device. The IQ plus 590-DC can send or receive any ASCII character value (decimal 0–255), but the indicator display is limited to the set described in Section 8.4 on page 37.

Figure 8-2. IQ plus 590-DC Display Characters

## 8.5 Conversion Factors for Secondary Units

The IQ plus 590-DC has the capability to mathematically convert a weight into many different types of units and instantly display those results with a press of the UNITS key. Secondary units can be specified on the FORMAT menu using the SECNDR parameter, or by using EDP commands.

- To configure secondary units using the front panel menus, use Table 8-4 to find the conversion multiplier for the MULT parameter. For example, if the primary unit is pounds and the secondary unit is short tons, set the MULT parameter to 0.00050, then press to save the value.
- To configure secondary units using EDP commands, use the Table 8-4 to find the conversion multiplier for the SEC.MULT command. For example, if the primary unit is pounds and the secondary unit is short tons, send the EDP command SEC.MULT= 0.0005<CR> to set the multiplier for the secondary units.
- Long tons and grains units listed in Table 8-4 cannot be directly specified as primary or secondary units on the IQ plus 590-DC indicator. For these or other unlisted units of weight, specify NONE on the UNITS parameter.

**NOTE:** Ensure that the secondary decimal point position is set appropriately for the scale capacity in the secondary units. If the converted value requires more digits than are available, the indicator will display an overflow message (*OVERFL*).

For example, if the primary units are short tons, secondary units are pounds, and the secondary decimal point is set to 8888.88, the indicator will overflow if 5 tons or more are applied to the scale. With 5 tons applied, and a conversion factor of 2000, the secondary units display needs five digits to the left of the decimal point to display the 10000 lb secondary units value.

Primary Unit	x Multiplier	Secondary Unit
grains	0.06480	grams
	0.00229	ounces
	0.00014	pounds
	0.00006	kilograms

Table 8-4. Conversion Factors

## 8.6 Digital Filtering

The IQ plus 590-DC uses averaged digital filtering to reduce the effect of vibration on weight readings. Adjustable threshold and sensitivity functions allow quick settling by suspending filter averaging, allowing the weight reading to jump to the new value. Figure 8-3 shows the digital filter parameters on the CONFIG menu.

Figure 8-3. Digital Filtering Parameters on the Configuration (CONFIG) Menu

Figure 8-4. Flow Diagram for IQ plus 590-DC Digital Filters

#### 8.6.1 DIGFLx Parameters

The first three digital filtering parameters, DIGFL1, DIGFL2, and DIGFL3, are configurable filter stages that control the effect of a single A/D reading on the displayed weight. The value assigned to each parameter sets the number of readings received from the preceding filter stage before averaging (see Figure 8-4).

The overall filtering effect can be expressed by multiplying the values assigned to the three filter stages:

DIGFL1 x DIGFL2 x DIGFL3

For example, if the filters are configured as DIGFL1=4, DIGFL2=8, DIGFL3=8, the overall filtering effect is 256 (4 x 8 x 8). With this configuration, each A/D reading has a 1-in-256 effect on the displayed weight value. Setting the filters to 1 effectively disables digital filtering  $(1 \times 1 \times 1 = 1)$ .

#### 8.6.2 DFSENS and DFTHRH Parameters

The three digital filters can be used by themselves to eliminate vibration effects, but heavy filtering also increases settling time. The DFSENS (digital filter sensitivity) and DFTHRH (digital filter threshold) parameters can be used to temporarily override filter averaging and improve settling time:

- DFSENS specifies the number of consecutive scale readings that must fall outside the filter threshold (DFTHRH) before digital filtering is suspended.
- DFTHRH sets a threshold value, in display divisions. When a specified number of consecutive scale readings (DFSENS) fall outside of this threshold, digital filtering is suspended. Set DFTHRH to NONE to turn off the filter override.

#### 8.6.3 Setting the Digital Filter Parameters

Fine-tuning the digital filter parameters greatly improves indicator performance in heavy-vibration environments. Use the following procedure to determine vibration effects on the scale and optimize the digital filtering configuration.

- In setup mode, set all three digital filters (DIGFL1, DIGFL2, DIGFL3) to 1. Set DFTHRH to NONE. Return indicator to normal mode.
- 2. Remove all weight from the scale, then watch the indicator display to determine the magnitude of vibration effects on the scale. Record the weight below which all but a few readings fall. This value is used to calculate the DFTHRH parameter value in Step 4.
  - For example, if a heavy-capacity scale produces vibration-related readings of up to 50 lb, with occasional spikes to 75 lb, record 50 lb as the threshold weight value.
- 3. Place the indicator in setup mode and set the digital filters (DIGFLx) to eliminate the

- vibration effects on the scale. (Leave DFTHRH set to NONE.) Reconfigure as necessary to find the lowest effective values for the DIGFLx parameters.
- 4. With optimum values assigned to the DIGFL*x* parameters, calculate the DFTHRH parameter value by converting the weight value recorded in Step 2 to display divisions:

threshold\_weight\_value / DSPDIV

- In the example in Step 2, with a threshold weight value of 50 lb and a display division value of 5D: 50 / 5D = 10. DFTHRH should be set to 10DD for this example.
- 5. Finally, set the DFSENS parameter high enough to ignore transient peaks. Longer transients (typically caused by lower vibration frequencies) will cause more consecutive out-of-band readings, so DFSENS should be set higher to counter low frequency transients.

Reconfigure as necessary to find the lowest effective value for the DFSENS parameter.

#### 8.7 Test Mode

In addition to normal and setup modes, test mode provides a number of diagnostic functions for the IQ plus 590-DC, including:

- Display raw A/D count
- Set A/D offset and gain calibration
- Reset configuration parameters to default values
- Print indicator configuration

To enter test mode, press and hold the setup switch until the front panel display shows the word *TEST*. After about three seconds, the test mode display automatically shifts to the first test menu function, A/DTST.

**!** Caution

A/D calibration functions, ADOFFS and ADGAIN, must be used only by qualified service personnel, and only

after replacing A/D converter components. Improper A/D calibration may render the indicator unusable.

Figure 8-5 shows the Test Menu structure; Figure 8-6 shows the front panel key functions in test mode. Note that, because the Test Menu functions are all on a single menu level, the GROSS/NET  $(\nabla)$  key has no function. Press the ZERO  $(\wedge)$  key to exit test mode.

Table 8-5 on page 41 summarizes the test menu functions.

Figure 8-5. Test Menu

## TEST MODE KEY FUNCTIONS

Figure 8-6. Front Panel Key Functions in Test Mode

TEST Menu	1
Function	Description
A/DTST	Display A/D test
	Press and hold Enter key to display raw count from A/D converter.
ADOFFS	A/D offset calibration (–0.5 mv/V)
	<b>Read Caution! statement on page 40 before using this function.</b> Press and hold the setup switch, then press the Enter key to perform offset calibration.
ADGAIN	A/D gain calibration (+4.5 mv/V)
	<b>Read Caution! statement on page 40 before using this function.</b> Press and hold the setup switch, then press the Enter key to perform gain calibration.
DEFLT	Default parameters
	Press and hold the setup switch, then press the Enter key to reset configuration and calibration parameters to factory default values. This function is equivalent to using the RESETCONFIGURATION EDP command followed by the RS (reset) EDP command.
PRTCFG	Print configuration
	Press the Enter key to print the indicator configuration to the serial port. This function is equivalent to using the DUMPALL EDP command.

# **IQ plus 590-DC Limited Warranty**

Rice Lake Weighing Systems (RLWS) warrants that all RLWS equipment and systems properly installed by a Distributor or Original Equipment Manufacturer (OEM) will operate per written specifications as confirmed by the Distributor/OEM and accepted by RLWS. All systems and components are warranted against defects in materials and workmanship for two years.

RLWS warrants that the equipment sold hereunder will conform to the current written specifications authorized by RLWS. RLWS warrants the equipment against faulty workmanship and defective materials. If any equipment fails to conform to these warranties, RLWS will, at its option, repair or replace such goods returned within the warranty period subject to the following conditions:

- Upon discovery by Buyer of such nonconformity, RLWS will be given prompt written notice with a detailed explanation of the alleged deficiencies.
- Individual electronic components returned to RLWS for warranty purposes must be packaged to prevent electrostatic discharge (ESD) damage in shipment. Packaging requirements are listed in a publication, *Protecting Your Components From Static Damage in Shipment*, available from RLWS Equipment Return Department.
- Examination of such equipment by RLWS confirms that the nonconformity actually exists, and was not caused by accident, misuse, neglect, alteration, improper installation, improper repair or improper testing; RLWS shall be the sole judge of all alleged non-conformities.
- Such equipment has not been modified, altered, or changed by any person other than RLWS or its
  duly authorized repair agents.
- RLWS will have a reasonable time to repair or replace the defective equipment. Buyer is responsible for shipping charges both ways.
- In no event will RLWS be responsible for travel time or on-location repairs, including assembly or disassembly of equipment, nor will RLWS be liable for the cost of any repairs made by others.

THESE WARRANTIES EXCLUDE ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING WITHOUT LIMITATION WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. NEITHER RLWS NOR DISTRIBUTOR WILL, IN ANY EVENT, BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.

RLWS AND BUYER AGREE THAT RLWS'S SOLE AND EXCLUSIVE LIABILITY HEREUNDER IS LIMITED TO REPAIR OR REPLACEMENT OF SUCH GOODS. IN ACCEPTING THIS WARRANTY, THE BUYER WAIVES ANY AND ALL OTHER CLAIMS TO WARRANTY.

SHOULD THE SELLER BE OTHER THAN RLWS, THE BUYER AGREES TO LOOK ONLY TO THE SELLER FOR WARRANTY CLAIMS.

NO TERMS, CONDITIONS, UNDERSTANDING, OR AGREEMENTS PURPORTING TO MODIFY THE TERMS OF THIS WARRANTY SHALL HAVE ANY LEGAL EFFECT UNLESS MADE IN WRITING AND SIGNED BY A CORPORATE OFFICER OF RLWS AND THE BUYER.
